

I would rather graph the points to find the slope.

$(4, -2)$ & $(-8, 5)$

I would rather use the slope formula to find the slope.

It doesn't matter which points I pick to find the slope of the line.

The points I pick matter when finding the slope of the line.

This function is linear

I would rather make a mapping diagram.

$(0, -3)$ $(-1, 5)$ $(4, -3)$ $(0, 0)$
 $(-3, 2)$ $(-4, 1)$ $(2, -3)$

This function is non-linear.

I would rather make a table.
